Synopsis :

Thermodynamics is a basic science that deals with energy. This course introduces students to the basic principles of thermodynamics. It will discuss basic concepts and introduces the various forms of energy and energy transfer as well as properties of pure substances. A general relation for the conservation of energy principle will be developed and applied to closed systems and extended to open systems. The second law of thermodynamics will be introduced and applied to cycles, cyclic devices and processes.

Course Learning Outcomes :

At the end of the course, students should be able to:

1. explain the basic concepts of thermodynamics, energy, energy transfer and laws of thermodynamics
2. determine the thermodynamics properties based on property tables, equations of states and charts
3. analyze closed and open thermodynamics systems using the first law of thermodynamics
4. analyze performance of reversible and actual heat engine, refrigerator and heat pump cycles based on the first and second laws of thermodynamics
5. analyze the entropy change during thermodynamics processes and calculate the isentropic efficiency of various steady flow devices
